Summary

- Spark is a framework for coding your distributed data processing applications.
 - You will need a platform for running your Spark applications.
 - Spark platforms are available in cloud and on-premise infrastructure.
 - Databricks is the most popular cloud Spark platform.
 - Spark projects on the Databricks platform are often developed using Notebook environments.
 - We will use the free Databricks Community edition of the notebook environment
 - We will also learn to use PyCharm IDE for local development
 - Cloudera is the most popular on-premise Spark platform
 - Spark projects on the Cloudera platform are often developed using PyCharm or VSCoDe IDE.
- • We will learn to use PyCharm IDE for local development at a later stage of the course
